Valentine's Day Website

Create a one-page Valentine's Day website.

Create a folder and name it **Valentine**. You should have an **Image Folder**, a **Private Folder** and an **Index File** inside your **Valentine Folder**.

Go to www.flamingtext.com and create a heading for your web page. Examples of headings might be:

- Valentine's Day
- Valentine's Day History
- Valentine's Day Recipes
- Valentine's Day Gift Ideas
- Valentine's Day Jokes
- Famous Lovers
- Valentine's Day Quotes

Save your "flamingtext" heading in your image folder.

Open your index page. If you would like to change the background color of your index page, right click – page properties – formatting – colors – background. You can also change the text color on your index page here.

Create a table on your index page. If desired, you can change the color of your table (table properties and/or your cells (cell properties)).

Insert your heading on your index page.

Find clipart and/or graphics for your web page. Save your clipart/graphics in your image folder.

Add text. Use a san-serif font on your web page.

Add clipart and/or graphics from your image folder (Insert – Picture – From File).

Remove your table borders (Table Properties – Borders – Size 0).

Click **Preview** to see what your website will look like online. The user should only have to scroll down to view your website. The user should **not** have to scroll horizontally to see your Valentine's Day website.

Click **Design** to continue working on your website.

Remember to save your "Index" page often.

Be creative and have fun.
